

CREDO

Move ownership with verifiable payment.

USDC stays final on Ethereum. The RWA stays native on Creditcoin. Only cryptographic proof crosses chains.

Proof-triggered RWA settlement

02

Cross-chain RWA settlement breaks at the trust boundary.

Payments may be final, yet delivery still depends on bridges, wrappers, or privileged operators.

- | | | |
|----|-----------------------|---|
| 01 | BRIDGE RISK | Final USDC becomes wrapped exposure. |
| 02 | ORACLE TRUST | A backend assertion replaces cryptographic evidence. |
| 03 | OPERATOR POWER | One compromised key can redirect settlement. |
| 04 | WEAK BINDING | A payment can settle the wrong buyer, asset, amount, or window. |

03

Move proof—not money or assets.

Credo separates what must remain native from what must cross.

PAYMENT**ETHEREUM SEPOLIA**

USDC stays final

NO BRIDGE

EVIDENCE**ATTESTCOIN**

Receipt + continuity proof

ONLY THIS CROSSES

OWNERSHIP**CREDITCOIN CC3**

ERC-1155 changes owner

CONTRACT DECIDES

04

One payment. One proof. One release.

The worker observes; Attestcoin proves; the contract owns the decision.

PAYMENT STAYS ON ETHEREUM

OWNERSHIP STAYS ON CREDITCOIN

05

Settlement has one admissible path: exact proof match.

Verified bytes—not worker claims—must satisfy every on-chain constraint.

Verifier precompile accepts inclusion + continuity

Receipt status is successful

Emitter is official Sepolia USDC

Buyer, seller, amount, token, and window match

Exactly one Transfer event matches

Query ID has never been used

06

The worker carries evidence—never authority.

Settlement power remains inside non-upgradeable contract logic.

CONTRACT ENFORCES

- + Release and replay marker are atomic
- + Checks-effects-interactions + reentrancy guard
- + One open sale per exact payment tuple
- + Reclaim only after payment window + grace

OPERATOR CANNOT

- Force-settle escrowed assets
- Mark arbitrary proofs as verified
- Change buyer after sale creation
- Touch funds or hold privileged roles

07

A complete testnet settlement closes the loop.

Distinct buyer and seller wallets; official Sepolia USDC; final ownership on CC3.

The protocol is already usable through a guided playground.

Builders can inspect the flow, open evidence, and integrate against documented contracts.

The screenshot shows the Credo web application interface. At the top is a navigation bar with the Credo logo, links for Product, Developers, and Documentation, and a prominent 'Open Playground' button. The main content area is titled 'GUIDED TESTNET SIMULATION' and features the heading 'Watch a payment become ownership.' Below this, a descriptive paragraph states: 'Walk through a realistic Credo settlement from sale configuration to ERC-1155 release. Every value mirrors the verified v3 testnet run, while simulated actions spend no funds and send no transaction.' To the right of the text is a progress indicator with three columns: '6 STAGES', '3 NETWORKS', and '0 FUNDS USED'. Below the text and progress indicator is a dark header bar containing 'GUIDED TESTNET SIMULATION', 'SCENARIO - VERIFIED V3 SETTLEMENT', and buttons for 'Connect wallet — optional' and 'Run without wallet'. The main content area below the header shows a 'SALE BRIEF' for 'Demo RWA #1001', described as 'One ERC-1155 unit · curated testnet asset'. It includes a 'Price' field set to '5.00 USDC' and a 'DRAFT' status button.

WHAT SHIPS

- Wallet-free simulation
- Evidence links for each state
- API reference + ABI downloads
- Typed errors and request IDs
- Worker automation path

The stack is tested from contract to application.

The latest recorded audit verifies the deployed v3 path and its settlement invariants.

INVARIANT CALLS

CLEAN

TYPECHECK + LINT + BUILD

Security posture

Reentrancy finding resolved. Remaining Slither note is the intentional reclaim timestamp comparison.

Credo is a settlement layer—not a marketplace.

The protocol owns truth; ecosystem products own discovery, pricing, compliance, and experience.

CREDO CORE

Escrow + deterministic release

Attestcoin verification

Payment-intent uniqueness

Replay protection

Worker automation

BUILDER SURFACE

RWA marketplaces

OTC and private sales

Issuance + compliance apps

Portfolio and analytics products

Any DvP-enabled experience

11

Scale the primitive without weakening the trust model.

The current testnet release is proven; the next phases expand access and asset coverage.

HONEST LIMIT: payment is irreversible before Creditcoin release; this is proof-triggered settlement, not an atomic two-chain swap.

CREDO

Proof crosses. Ownership moves.

No bridge. No wrapped USDC. No trusted worker.

Build on the settlement layer
